Strategy Package

Objective: modernize DevOps tooling and trusted engineering analytics without destabilizing delivery.

Target operating model: GitHub Enterprise, Azure Boards traceability, GitHub Actions validation, and Power BI Desktop reporting.

Platform engineering: reusable workflows, self-hosted runners for legacy workloads, and minimal permission scopes.

Data engineering: local Bronze/Silver/Gold pipeline, explicit quality checks, and Power BI Desktop reporting.

90-day plan: baseline metric definitions, pilot migration, runner review, and governance checkpoints.

Risks: disputed metrics, runner exceptions, and developer friction require executive decision-making and clear trade-offs.

Data caveat: build runs and incident records do not provide verified deployment frequency or event-linked change failure rate.
